HTML & CSS EXERCISE 3

Skills: Flexbox

Build the following layout in HTML and CSS, using flexbox. The layout should take up 100% of the width and height, even when the window is resized. (When expanded vertically, the middle article & sidebar portion expands as necessary.) Start with the following CSS starter which sets up the borders and padding, so you only need to focus on the flexbox layout.

```css
/* Goofy borders around everything to help us see the layout. */
* {
    border: 2px solid cornflowerblue;
    margin: 5px;
    padding: 3px;
}

/* body takes up full viewport and extends all the way to the edges. */
html, body {
    margin: 0;
    padding: 0;
    border: none;
}
body {
    height: 100vh;
}
```

Title	Some Page	Another Page	Link This

Main Article (3/4 width)	Sidebar (1/4 width)
